When It Comes To Basement Finishing, It's Safety First!

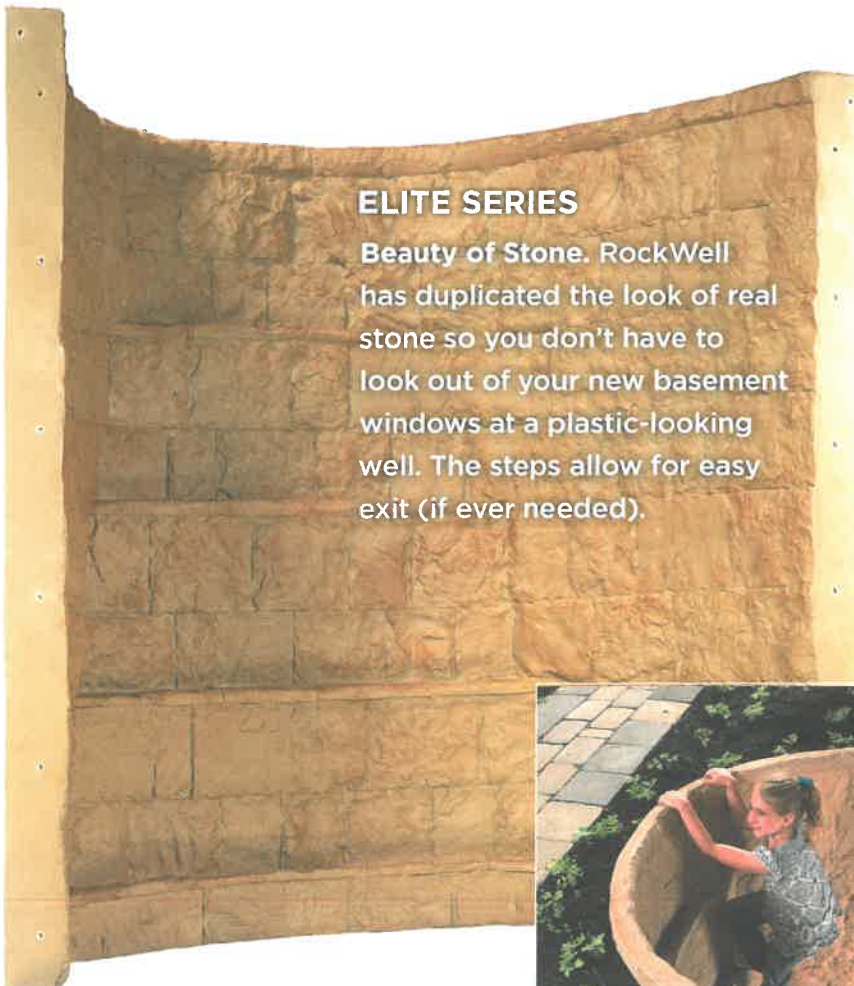

Creating living spaces in basements is good for your family and the value of your home. When finishing your basement, building codes often require that 'egress windows' (large enough to climb out of in the event of an emergency) be installed. This means a large window well with a step in it must be used outside the egress window.

A commonly used well has been a plastic design of flat parts that snap together to form the walls and steps. A problem lies in its durability and strength.

RockWell Window Wells are a one-piece, rigid construction that will not collapse from backfill or allow water to leak through the well walls. They're UV stable, rust and rot proof, and stand up to extreme temperatures.

Well Covers. A polycarbonate cover keeps leaves and debris out while allowing natural sunlight to enter your basement. While they are not intended for continual foot traffic, the 10mm fluted polycarbonate cover will hold up to 500 lbs. of weight and prevent family members from accidentally falling into the window well.

ELITE SERIES

Beauty of Stone. RockWell has duplicated the look of real stone so you don't have to look out of your new basement windows at a plastic-looking well. The steps allow for easy exit (if ever needed).
